

## Lab 4: Perform NFS Enumeration

### Lab Scenario

As a professional ethical hacker or penetration tester, the next step after LDAP enumeration is to perform NFS enumeration to identify exported directories and extract a list of clients connected to the server, along with their IP addresses and shared data associated with them.

After gathering this information, it is possible to spoof target IP addresses to gain full access to the shared files on the server.

### Lab Objectives

- Perform NFS enumeration using RPCScan and SuperEnum

### Overview of NFS Enumeration

NFS (Network File System) is a type of file system that enables computer users to access, view, store, and update files over a remote server. This remote data can be accessed by the client computer in the same way that it is accessed on the local system.

Task 1: Perform NFS Enumeration using RPCScan and SuperEnum

RPCScan communicates with RPC (remote procedure call) services and checks misconfigurations on NFS shares. It lists RPC services, mountpoints, and directories accessible via NFS. It can also recursively list NFS shares. SuperEnum includes a script that performs a basic enumeration of any open port, including the NFS port (2049).

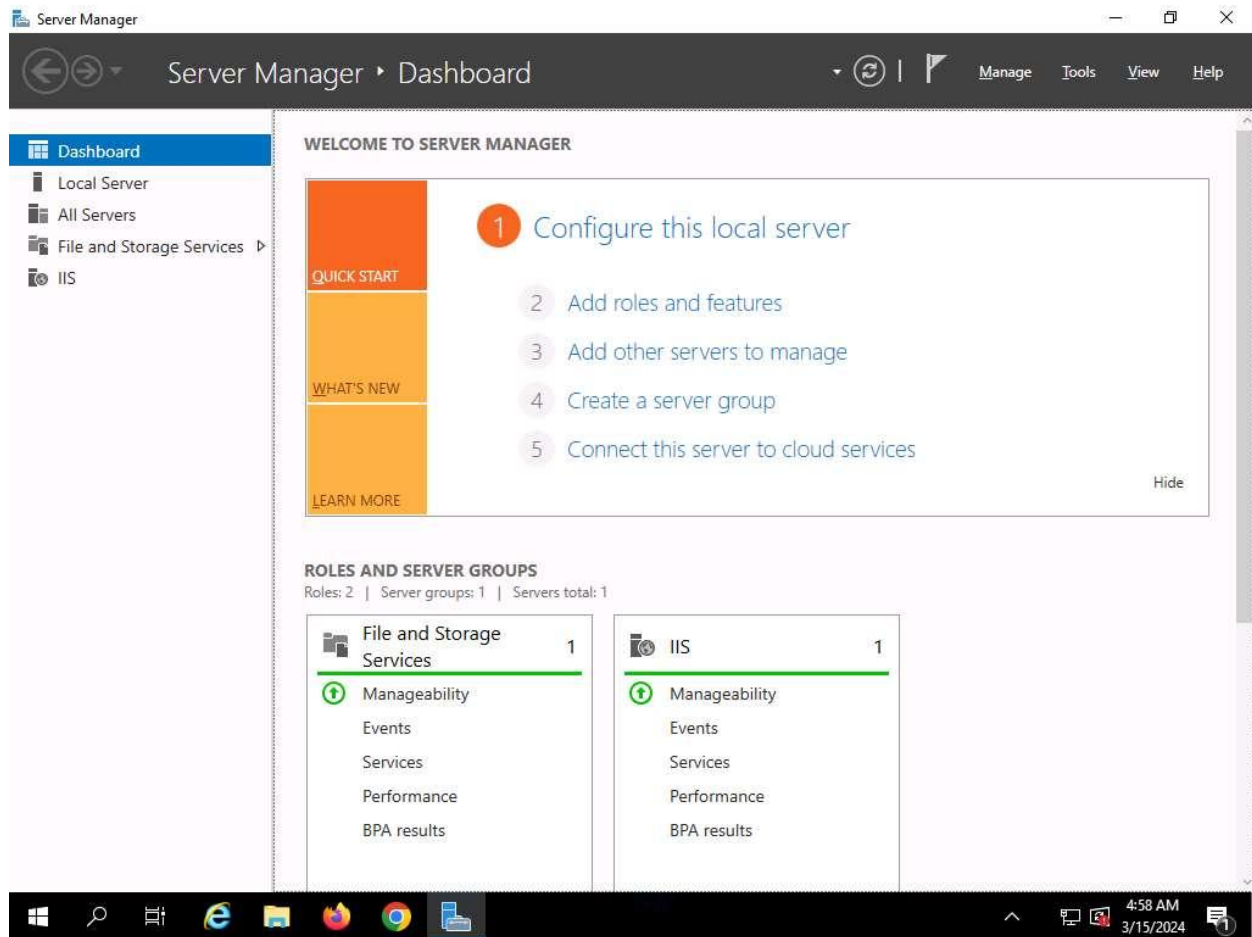

Here, we will use RPCScan and SuperEnum to enumerate NFS services running on the target machine.

Before starting this task, it is necessary to enable the NFS service on the target machine (**Windows Server 2019**). This will be done in **Step#1-6**.

1. Click [Windows Server 2019](#) to switch to the **Windows Server 2019** machine. In the **Windows Server 2019** machine, click the **Start** button at the bottom-left corner of **Desktop** and open **Server Manager**.

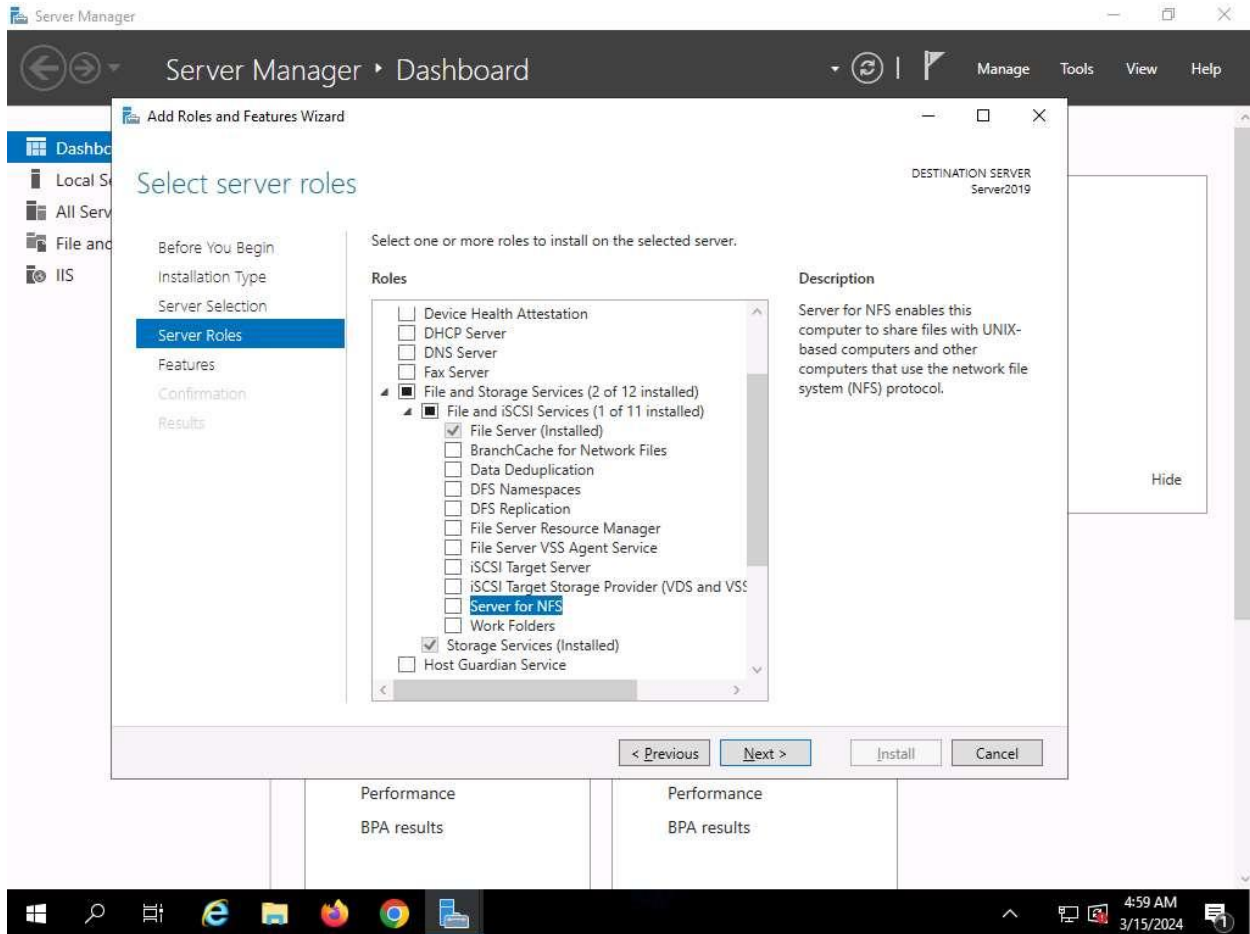

If you are logged out of the **Windows Server 2019** machine, click [Ctrl+Alt+Delete](#), then login with **Administrator/Pa\$\$w0rd**.

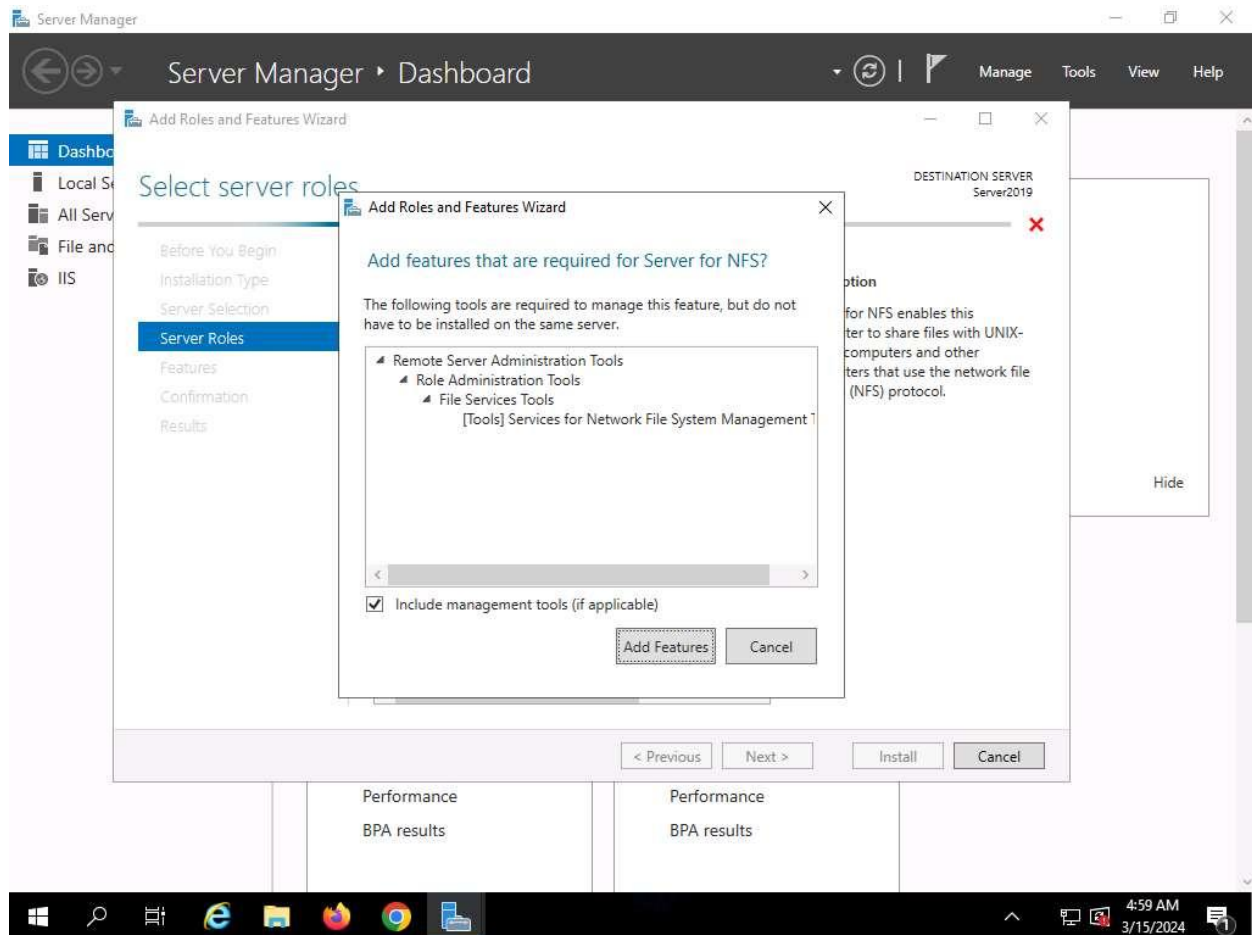

2. The **Server Manager** main window appears. By default, **Dashboard** will be selected; click **Add roles and features**.

3. The **Add Roles and Features Wizard** window appears. Click **Next** here and in the **Installation Type** and **Server Selection** wizards.
4. The **Server Roles** section appears. Expand **File and Storage Services** and select the checkbox for **Server for NFS** under the **File and iSCSI Services** option, as shown in the screenshot. Click **Next**.

In the **Add features that are required for Server for NFS?** pop-up window, click the **Add Features** button.

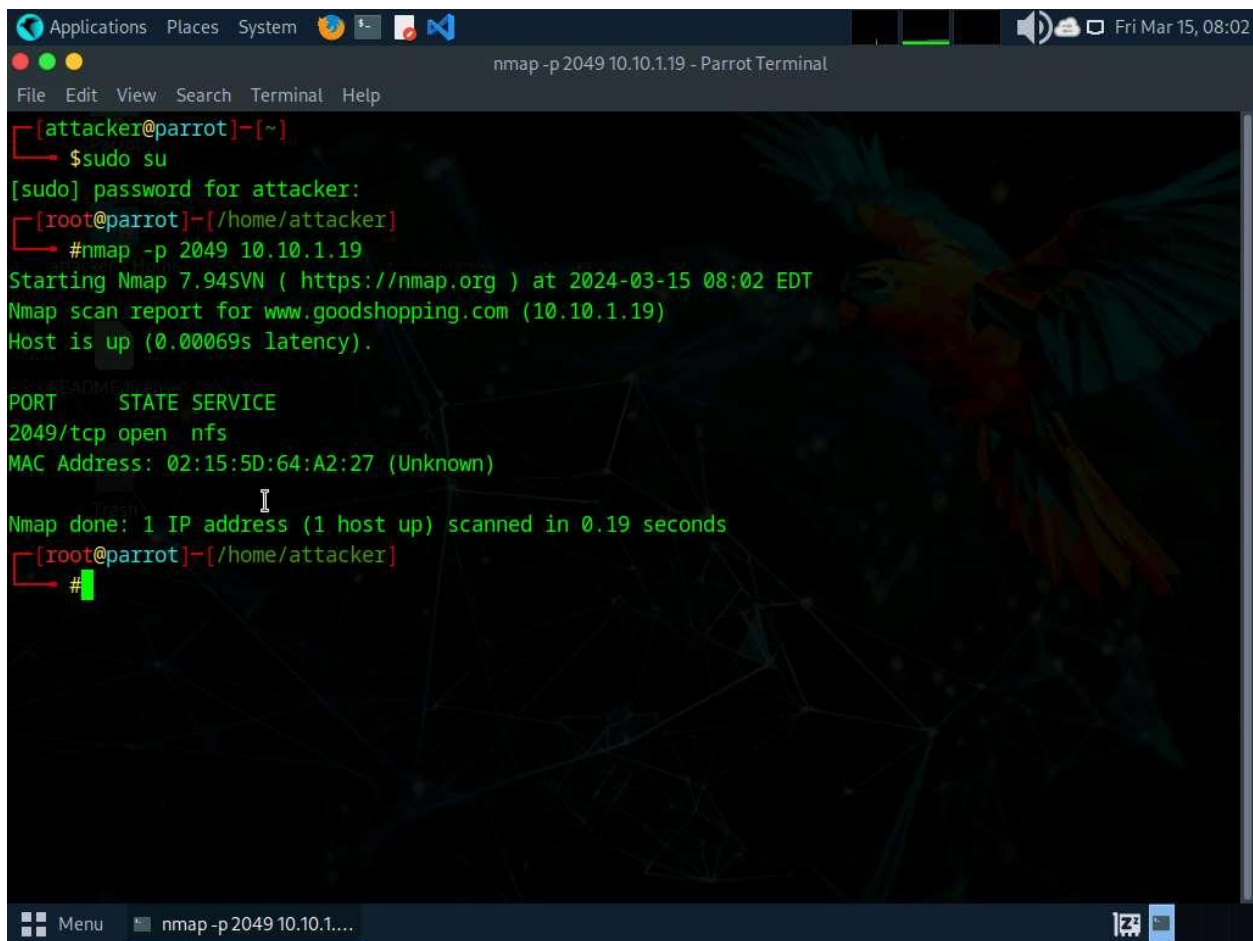

5. In the **Features** section, click **Next**. The **Confirmation** section appears; click **Install** to install the selected features.
6. The features begin installing, with progress shown by the **Feature installation** status bar. When installation completes, click **Close**.
7. Having enabled the NFS service, it is necessary to check if it is running on the target system (**Windows Server 2019**). In order to do this, we will use **Parrot Security** machine.
8. Click [Parrot Security](#) to switch to the **Parrot Security** machine. Open a **Terminal** window and execute **sudo su** to run the programs as a root user (When prompted, enter the password **toor**).

The password that you type will not be visible.

9. Execute **nmap -p 2049 [Target IP Address]** command (here the target IP address is , **10.10.1.19**).

**-p**: specifies port.

10. The scan result appears indicating that port 2049 is opened, and the NFS service is running on it, as shown in the screenshot.

```
Applications Places System [Icons] [Terminal] [Help]
nmap -p 2049 10.10.1.19 - Parrot Terminal
File Edit View Search Terminal Help
[attacker@parrot]~$ sudo su
[sudo] password for attacker:
[root@parrot]~/home/attacker# nmap -p 2049 10.10.1.19
Starting Nmap 7.94SVN ( https://nmap.org ) at 2024-03-15 08:02 EDT
Nmap scan report for www.goodshopping.com (10.10.1.19)
Host is up (0.00069s latency).

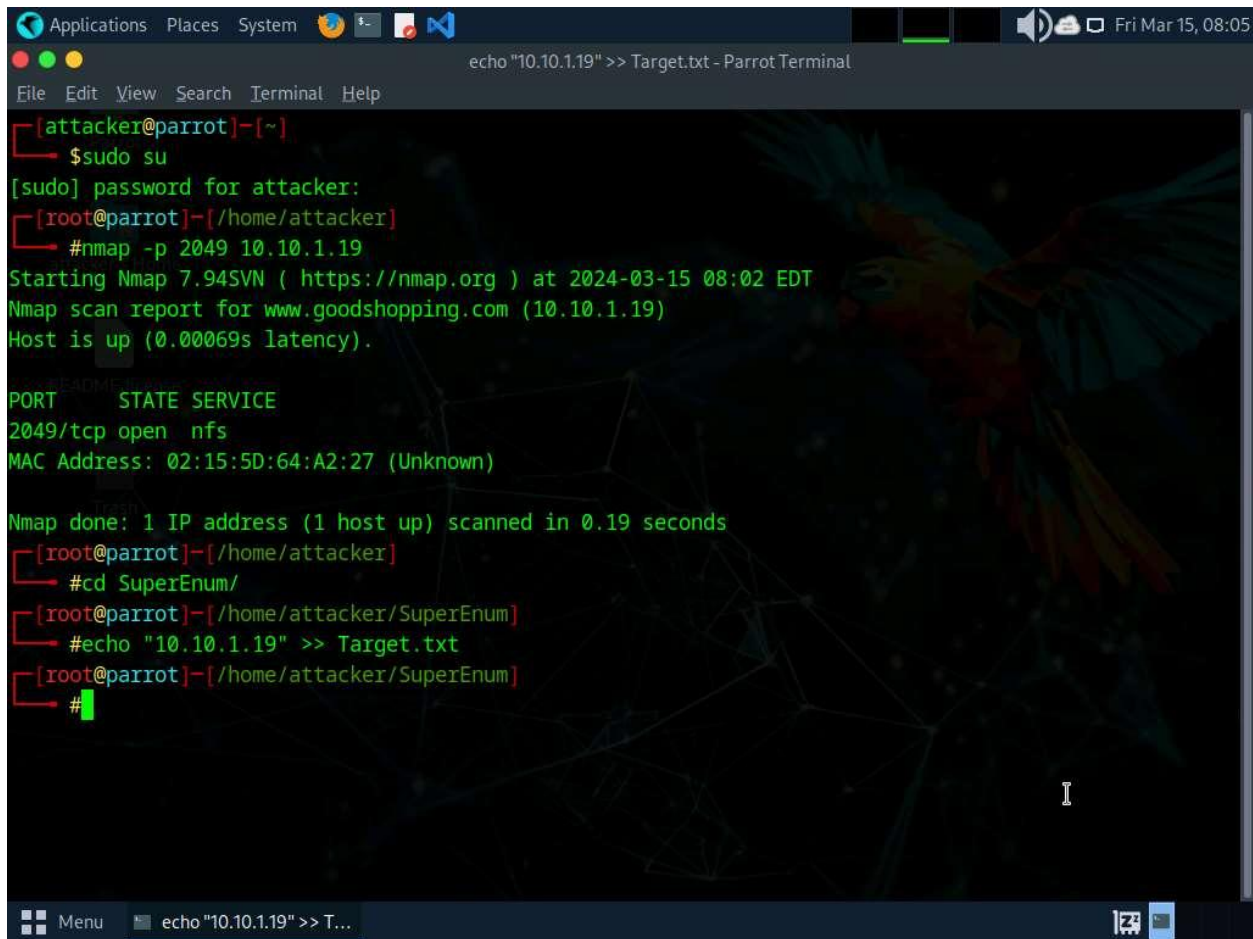

PORT      STATE SERVICE
2049/tcp  open  nfs
MAC Address: 02:15:5D:64:A2:27 (Unknown)

Nmap done: 1 IP address (1 host up) scanned in 0.19 seconds
[root@parrot]~/home/attacker# #
```

11. Run **cd SuperEnum** command to navigate to the **SuperEnum** folder.

12. Run **echo "10.10.1.19" >> Target.txt** command to create a file having a target machine's IP address (**10.10.1.19**).

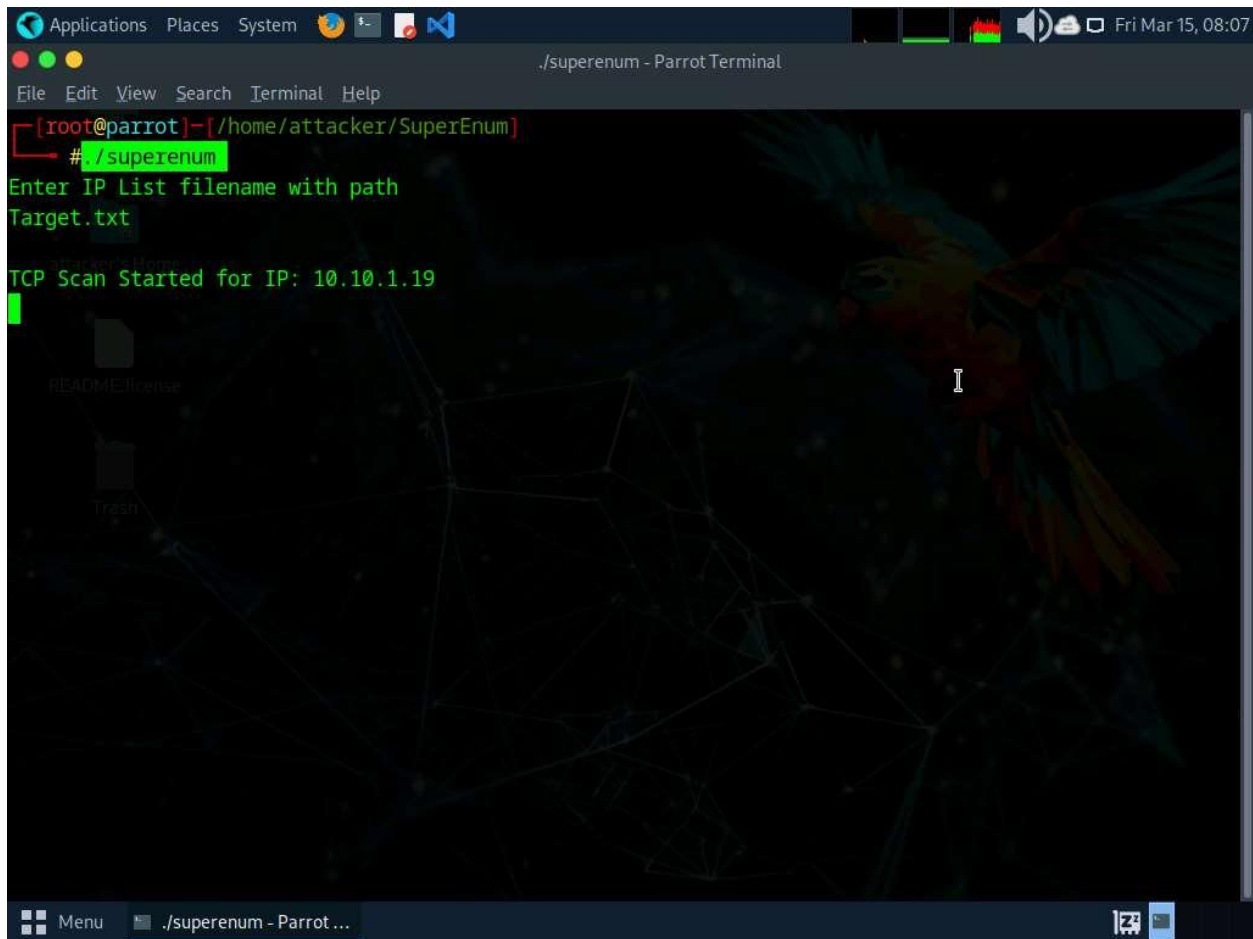

You may enter multiple IP addresses in the **Target.txt** file. However, in this task we are targeting only one machine, the **Windows Server 2019 (10.10.1.19)**.

```
[attacker@parrot]~  
$sudo su  
[sudo] password for attacker:  
[root@parrot]~/home/attacker  
#nmap -p 2049 10.10.1.19  
Starting Nmap 7.94SVN ( https://nmap.org ) at 2024-03-15 08:02 EDT  
Nmap scan report for www.goodshopping.com (10.10.1.19)  
Host is up (0.00069s latency).  
  
PORT      STATE SERVICE  
2049/tcp  open  nfs  
MAC Address: 02:15:5D:64:A2:27 (Unknown)  
  
Nmap done: 1 IP address (1 host up) scanned in 0.19 seconds  
[root@parrot]~/home/attacker  
#cd SuperEnum/  
[root@parrot]~/home/attacker/SuperEnum  
#echo "10.10.1.19" >> Target.txt  
[root@parrot]~/home/attacker/SuperEnum  
#
```

13. Execute `./superenum` command. Under **Enter IP List filename with path**, type **Target.txt**, and press **Enter**.

If you get an error running the `./superenum` script, execute `chmod +x superenum` command, then repeat **Step#13**.

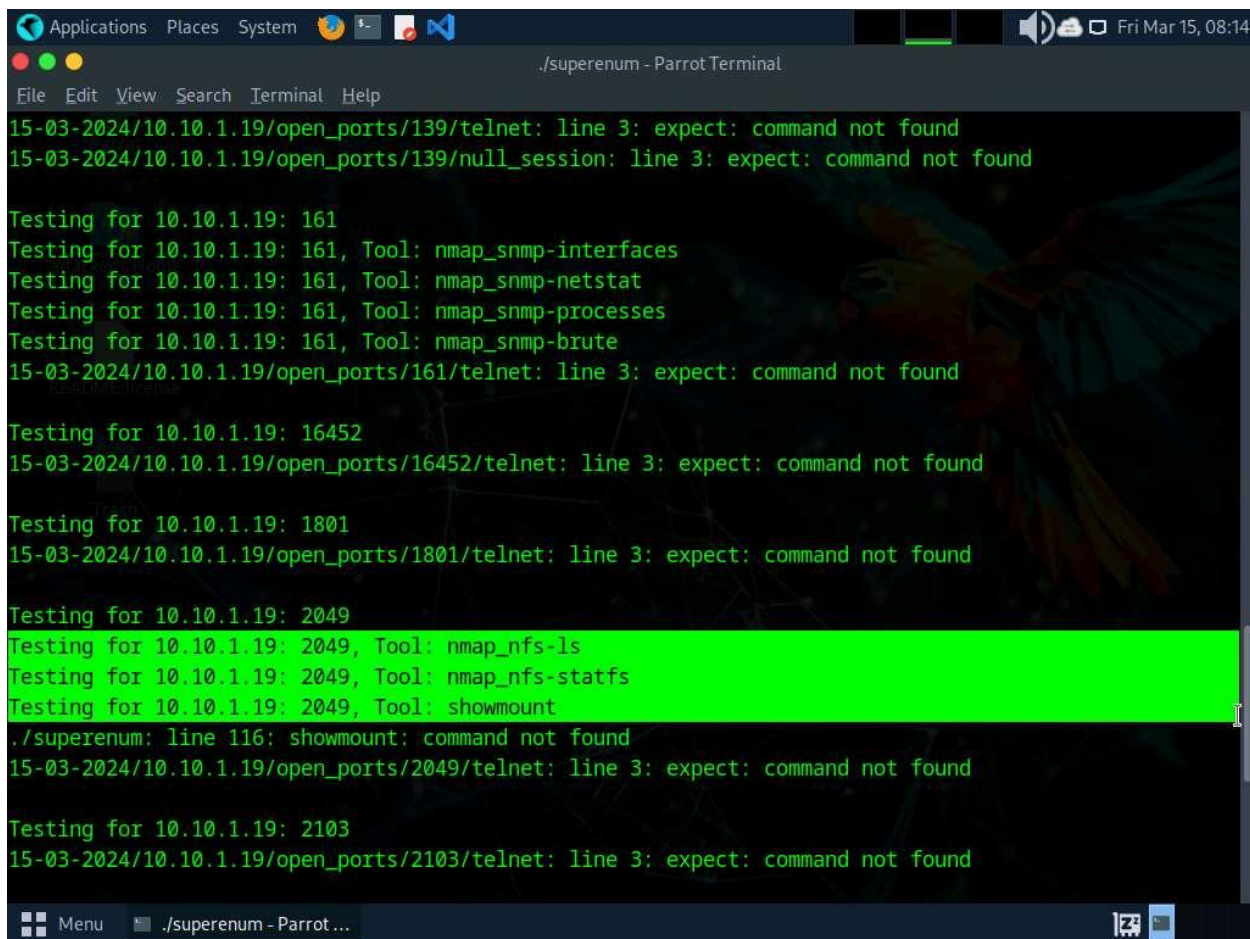

A screenshot of a Parrot OS terminal window. The window title is ".superenum - Parrot Terminal". The terminal shows the command prompt "[root@parrot]~/home/attacker/SuperEnum" and the user has entered "# ./superenum". The script prompts "Enter IP List filename with path" and the user has entered "Target.txt". The script then outputs "TCP Scan Started for IP: 10.10.1.19". The background of the terminal is a dark theme with a parrot and a network diagram. The window has a menu bar with "File", "Edit", "View", "Search", "Terminal", and "Help". The bottom status bar shows "Menu" and ".superenum - Parrot ...".

```
[root@parrot]~/home/attacker/SuperEnum
# ./superenum
Enter IP List filename with path
Target.txt
TCP Scan Started for IP: 10.10.1.19
```

14. The script starts scanning the target IP address for open NFS and other services.

The scan will take approximately 15-20 mins to complete.

15. After the scan is finished, scroll down to review the results. Observe that the port 2049 is open and the NFS service is running on it.

```

```

16. You can also observe the other open ports and the services running on them.

17. In the terminal window, run **cd ..** command to return to the root directory.

18. Now, we will perform NFS enumeration using RPCScan. To do so, run **cd RPCScan** command.

19. Execute **python3 rpc-scan.py [Target IP address] --rpc** command (here, the target IP address is **10.10.1.19**, the **Windows Server 2019** machine).

**--rpc**: lists the RPC (portmapper).

20. The result appears, displaying that port 2049 is open, and the NFS service is running on it.

```

21. This concludes the demonstration of performing NFS enumeration using SuperEnum and RPCScan.

22. Close all open windows and document all the acquired information.

#### Question 4.4.1.1

Perform NFS Enumeration using RPCScan and SuperEnum and find the port used by the NFS service on 10.10.1.19.
